

gardio MetaMask Snap

User Guide

1. Overview

This document outlines the integration of Gardio Snap with MetaMask to extend its functionality. The Gardio Snap enables MetaMask to manage Gardio hardware wallet accounts and securely sign transactions directly through the MetaMask interface.

2. Prerequisite

Install and setup MetaMask Flask Extension from here:

<https://chromewebstore.google.com/detail/metamask-flask-developmen/ljfoeinjpaedjfecbmggjgodbgkmjkjk>

MetaMask Flask is a developer-focused version of MetaMask that supports experimental features such as Snaps.

Disable the regular MetaMask extension to allow better communication with MetaMask Flask.

1. Connecting to MetaMask Flask via Gardio Website

To connect the Gardio Snap with MetaMask Flask, follow these steps:

- 1- Open the Gardio website: <https://gardiometamasksnap.web.app/>
- 2- A connection request will be sent to the MetaMask Flask extension. A MetaMask popup will appear—click **"Connect"**.
- 3- MetaMask will request permission to install the Snap. Click **"Confirm"** to proceed.
- 4- Once confirmed, the installation will be completed successfully.
- 5- **Verify Installation:** Open MetaMask Flask, click the three dots in the upper-right corner, select "Snaps", and confirm that the Gardio Wallet Snap appears in the list.

3. Adding (or Fetching) a New Account

To add or fetch a new account, start from the Gardio website:

<https://gardiometamasksnap.web.app/>

Click the **"Add Account"** button and follow the on-screen instructions to complete the process.

4. Signing a Transaction with Gardio Account

- 1- Open the “gardio Account” in MetaMask.
- 2- Enter the desired transaction parameters.
- 3- MetaMask will redirect you to the Gardio website to review and sign the transaction.
- 4- Gardio supports all transaction types: normal transfers, token transfers, NFTs, and Swap.

If the website is closed, the transaction will not be canceled. You can cancel it from MetaMask > Account > Activity.

You must cancel the pending transaction before you can make another one.

The gardio device does not support transactions larger than 1K. As a result, you may encounter “Error 17” when making smart contract transactions, especially during swaps.

Review Transaction

Please follow instructions on your device to confirm and complete transaction and verify the address displayed on your device exactly matches the one given to you by the Recipient

Recipient Address :	0x15a0a1a2ee18bec4ffd4c25ed4149cdaca3849be
Amount :	8.48636436653867823 ETH
Fees :	0.000630000001092 ETH
Chain ID :	0x89 (PoLygon)
Data Field :	Absent

DismissContinue

5. Signing a Message with MetaMask Flask on the Test dApp

- 1- Open the MetaMask Test dApp page from <https://metamask.github.io/test-dapp/>
- 2- Click **“Connect”** in the Connect Actions list and select **MetaMask Flask** from the extensions list.
- 3- Scroll down the page until you find the **“Personal Sign”** option to sign the message.

The screenshot displays the MetaMask Test dApp interface with three main signing sections: "Eth Sign", "Personal Sign", and "Sign Typed Data". Each section contains a blue "SIGN" button, a yellow "Result:" field, and a blue "VERIFY" button. The "Personal Sign" section is highlighted with a red border and includes additional yellow fields for "eth-sig-util recovery result:" and "personal_ecRecover result:". Below each section is a label: "Sign Typed Data V3" for the first, "Sign Typed Data V4" for the second, and "Sign Permit" for the third. A "Ciphertext:" field is visible at the top center.

The “Sign Typed Data” option is not supported by the Gardio device.
